

Genelec Smart IP Q & A

Q: What is Genelec Smart IP?

A: Genelec Smart IP is a revolutionary loudspeaker family for installed audio applications, supporting single cable connectivity via standard Ethernet networking protocols. Smart IP loudspeakers receive power and audio, plus monitoring and management signalling over a single Ethernet cable. Smart IP does not introduce any performance compromises in terms of maximum sound pressure level or acoustic quality. It provides complete professional quality room compensation and multi-loudspeaker system alignment tools built into all loudspeakers, and allows several complete setups to be stored within the loudspeaker's internal memory. Smart IP also enables easy integration into house automation systems by offering a public API command set.

Q: What makes Smart IP unique?

A:

- Single-cable connectivity using PoE+ without performance sacrifice.
- High maximum SPL on PoE+ power.
- Renowned Genelec audio and build quality.
- Support for open audio and IP standards.
- Uncompromising uncompressed low-latency audio streaming directly into each loudspeaker.
- Loudspeaker synchronisation to sub-microsecond level for solid acoustic imaging.
- Full set of acoustic room compensation and alignment tools built into each loudspeaker.
- Extensive accessory support.
- Complete public API command set.
- Designed and manufactured in Finland for high reliability, long lifetime and respecting environmental sustainability.

Q: What size of projects is Genelec Smart IP aimed at?

A: Almost any project, since the number of Smart IP loudspeakers in one installation is virtually unlimited, and IP networks themselves can support a very high loudspeaker count. This, with the very flexible audio streaming options available, enables complex installations with many speakers to be implemented quickly and easily.

Q: Is there actually an upper limit on the number of speakers in a system?

A: It depends mainly on how you set up your IP network and how many separate audio streams and other traffic you have on the network. A correctly configured network can support hundreds of Smart IP loudspeakers on the same LAN. For more information on technical specifics related to managing the audio synchronisation clock, see also <https://audinate.com/faq/what-s-maximum-number-devices-ultimo-only-network-can-support>.

Q: Is there a system management app I can use?

A: Yes. Genelec offers Smart IP Manager software for the audio system installer. The Smart IP Manager enables the creation of zones and supports the alignment of loudspeakers for different applications and acoustic situations. For day-to-day use, we recommend integrating Smart IP loudspeakers into house automation systems using the public API command set that we offer. The Smart IP Manager application is intended for the install engineer only, not the end user.

Q: My installation requires acoustical compensation. Can I do this with Smart IP?

A: Absolutely. Genelec Smart IP offers a complete set of acoustic controls inside each loudspeaker. These include a bank of 20 parametric filters that can be set to work as notches and high/low frequency shelving filters, to precisely compensate for room colouration effects. Delay and level alignment controls are also provided to align loudspeakers correctly for a variety of situations - such as creating precise playback systems for immersive audio applications, stage presentations, sound reinforcement applications, as well as background music purposes.

Each Smart IP loudspeaker offers internal memory to support several complete setups that can be easily recalled using public API commands. This enables house automation systems to quickly reconfigure even large installations for new uses, with excellent acoustic precision.

Smart IP loudspeakers have proven high-quality acoustic design that enables excellent performance even in acoustically challenging rooms and spaces. This, with the integral room compensation features ensures fast and accurate deployment in any installed audio application.

Q: How many channels does Smart IP support?

A: Each AES67 audio-over-IP stream received by the loudspeaker can contain up to 8 channels of audio, and you can run an unlimited number of parallel streams. AES67 uses precision time protocol (PTP) version 2 clocking and this ensures complete synchronisation of all parallel streams - so your channel count is not really limited. Very high channel count Dante streams can also be configured and received by Smart IP loudspeakers. Each loudspeaker outputs one of the audio channels in a stream, or the sum of two selected audio channels.

Q: What are your recommendations for the IP network performance?

A: Gigabit networking is recommended. For low channel count audio-only applications, a 100 Mbps network may be used as long as it uses QoS. For high channel count applications, a Gigabit network is strongly recommended. QoS should always be used when the network is also used for data other than audio.

Q: What are the recommended IP switch specs regarding PoE power?

A: We recommend that PoE+ standard IEEE 802.3at is supported in the switches for all outputs where loudspeakers are connected. To maximise performance, allow full power for each loudspeaker; this is the maximum of Class 4 power (30 W). If possible, choose a switch where LLDP power negotiation can be turned off. For additional information on selecting IP switches, visit <https://www.audinate.com/faq-catagories/switches>

Q: What Audio Over IP standards do you support?

A: Genelec Smart IP loudspeakers support open audio-over-IP streaming standards (AES67 and ST2110-30 audio streaming) as well as Audinate's Dante format.

Q: How do you configure the streams?

A: You can use Dante Controller to set up the streams.

Q: What are the requirements for network cabling?

A: CAT5e cable or better.

Q: Is it possible to daisy-chain Smart IP speakers?

A: Daisy-chaining in IP networks is not recommended, since it reduces the network capacity significantly. It is not possible to daisy-chain speakers, since they require PoE+ power from IP switches – therefore direct connection to an IP switch or PoE+ injector is necessary.

Q: Which version of PoE is needed for the system?

A: Smart IP loudspeakers support IEEE 802.3at (30 W) and IEEE 802.3af (15 W) standards. The loudspeakers always output the maximum amplifier power, but using a lower standard reduces the time of maintaining the output at maximum power.

Q: How do I power the loudspeaker?

A: Use an IP switch that supports PoE+ power. Alternatively, use PoE+ power injectors before the loudspeaker.

Q: What are the options to provide IP-addresses in small and large systems?

A: We primarily suggest using automatic IP address assignment with DHCP protocol. Alternatively, we also support Auto IP and static IP addresses in loudspeakers.

Q: Do you support open control? What kind of API are you offering?

A: Genelec Smart IP loudspeakers offer a public API. This is a command set that enables house automation systems to manage and monitor Smart IP loudspeakers. For example, the API can adjust volume, select one of several pre-programmed settings, and turn the loudspeaker on and off. Monitoring of loudspeaker activity is also supported. Pre-programmed settings can include all acoustic settings, audio input as well as other settings.

Q: What kind of information can I read from the speaker?

A: You can monitor device status and settings. For more information on API, consult the Smart IP Operating Manual.

Q: Do you offer ready-made drivers for control systems?

A: Genelec provides Smart IP Manager software for the complete setup of all acoustic features, as well as other operational parameters in the loudspeakers.

Q: What happens if I lose power?

A: When power returns, Smart IP loudspeakers will resume normal operation automatically. The setting used is the last setting that was in use before power-down.

Q: Does the Smart IP support redundancy?

A: No, Smart IP loudspeakers support one Ethernet port only.

Q: How is the acoustic performance compared to Genelec 4000 series models?

A: Smart IP loudspeakers use the same acoustic design as the 4000 series, but offer improved performance because of the digital signal processing employed.

Q: How do you control speaker volume?

A: The audio streaming into each loudspeaker is uncompressed and fast. Therefore you can adjust system playback level at the source, or you can also adjust loudspeaker level with public API commands.

Q: Genelec Smart IP supports zones. What does this mean?

A: During the system setup, Genelec Smart IP Manager software can assign each loudspeaker to one or more zones. Each zone shares the output level (volume) setting and one of the several pre-programmed settings stored in each loudspeaker. Zones can be used to implement multiple methods of using loudspeakers in a space, or for addressing separate areas with specific settings.

Q: What kind of accessories do you provide for Smart IP loudspeakers?

A: An extensive selection of accessories provides numerous mounting options for easy, hassle-free installation. Please visit the Genelec website for a complete list of accessories.

Q: What colours are Smart IP speakers available in?

A: The colours available are black or white, plus a selection of 120 RAL colour options similar to those of the 4000 series.
